Research Project Lifecycle Management
an IMPROVER project

ADDITIONAL INFORMATION

Document number: 1005/FvdP

Date: October 13th 2020

ADDITIONAL INFORMATION AS A RESPONSE TO QUESTIONS RAISED

There can be internal and external deadlines and certain process steps will require other process steps (e.g. approvals) to be finished first. In several cases, fixed workflows will be needed to ensure process compliance. Such workflows depend on the nature of the research done (e.g. human vs non-human).

There will be meta data that needs to be registered. Single data entry will save precious time. Meta data elements will be research type specific.

In case time registration on a project is offered as part of the solution, it will be considered. That also applies to project planning functionality.

The role-based solution should either include a document management system or be able to connect with an existing document management system in order to improve efficiency and collaboration amongst different departments and enable saving, sharing and maintaining documents efficiently.

The solution should cover the entire research project lifecycle, end-to-end process, for both human and non-human research. Scientists should be able to focus on research, not losing precious time because of cumbersome or bureaucratic supporting processes and systems.

The proposed solution should offer flexible connection possibilities with other systems and platforms.
