II.2.4) Description of the procurement:

(nature and quantity of works, supplies or services or indication of needs and requirements)

A full read-out of the metabolome provides a wealth of information that can be used to identify metabolic profiles that predict disease risk, disease progression, and treatment outcome. Studies have shown that usually thousands of samples are necessary to find novel metabolic biomarker profiles, and even more for validation and replication. The number of samples increases even further when we want to identify early disease biomarkers using population-based metabolic profiling. To realise the potential of metabolomics for disease prediction and precision medicine, large-scale data acquisition is needed with sample sizes typically in the order of tens to hundreds of thousands. The analytical challenge posed by high-throughput metabolomics drives technological developments into the direction of more exhaustive analysis using smaller samples and shorter analysis times at a lower cost-per-sample.

We aim to set up a high-throughput, fully automated modular metabolomics lab including sample preparation, sample delivery, and data acquisition.
