Flyer 'uw gedrag in het stemhokje'	

the 1990s, the incidence of *S. flexneri* has increased in the United Kingdom [10]. In the United States, *S. flexneri* has been reported as the most common serotype in children with acute bacterial dysentery [11]. In the United Kingdom, *S. flexneri* has been reported as the most common serotype in children with acute bacterial dysentery [12].

There is a paucity of data on the epidemiology of *S. flexneri* in the United Kingdom. The only published study of *S. flexneri* in the United Kingdom was a case-control study of 10 cases of *S. flexneri* infection in children, which found that the risk of infection was significantly increased in children who had been in contact with a case of *S. flexneri* infection [13]. The study also found that the risk of infection was significantly increased in children who had been in contact with a case of *S. flexneri* infection who had been in contact with a case of *S. flexneri* infection.

The aim of this study was to determine the epidemiology of *S. flexneri* in the United Kingdom. The study was designed to determine the prevalence of *S. flexneri* in children with acute bacterial dysentery, the serotypes of *S. flexneri* isolated from children with acute bacterial dysentery, and the risk factors for *S. flexneri* infection in children with acute bacterial dysentery.

The study was conducted in the United Kingdom, and the results are presented in this paper.
